Weather Detectives

Fog is one of the more difficult parameters to verify when conducting forensic weather studies. However, there are certain situations where meteorologists can confirm or deny the presence of fog at the scene of an incident.

The AccuWeather Forensics Team was called upon to investigate a car accident potentially due to fog. The accident occurred on an autumn day, alongside a river, during the morning rush-hour.

The following video describes the investigative work done for this case by the AccuWeather Forensics Team.
